

# Gnomonic Projection Azimuth

The Gnomonic Projection Azimuth is the observer-relative orientation coordinate of an accepted OMI relation.

It does not validate the relation.

It does not establish gauge incidence.

It does not accept state.

It receives a bounded relation that has already been resolved, validated, and inscribed, and determines how that relation is oriented when projected from the OMI n-sphere onto an inspectable tangent plane.

The complete unsigned azimuthal circle is:

```
0x00..0xFF
```

This gives 256 discrete angular positions.

```
angle(byte) = byte × 360° / 256
```

Canonical quarter positions are:

```
0x00 = 0°  
0x40 = 90°  
0x80 = 180°  
0xC0 = 270°
```

The circle closes after `0xFF` by returning to `0x00`.

The complementary azimuthal anchors are:

```
0x55 = 01010101  
0xAA = 10101010
```

They satisfy:

$$0x55 \wedge 0xAA = 0xFF$$

Their joined balanced orientation words are:

0x55AA  
0xAA55

Each contains eight one bits and eight zero bits.

They represent two complementary alternating orientations of the same projection axis.

They are not validation witnesses.

They are not incidence witnesses.

They are projection-orientation witnesses.

The complete protocol narrative is:

Omicron places the sign.

Omicron resolves the circular field.

Tetragrammatron closes the relation.

Metatron scribes the incidence path.

Gnomonic Projection Azimuth orients the accepted relation.

Receipt records the result.

The four control gauges:

FS = 0x0001  
GS = 0x0010  
RS = 0x0100  
US = 0x1000

identify the place-value orientation from which the notation is resolved.

Their stepping law is:

FS <<<sub>4</sub> GS <<<sub>4</sub> RS <<<sub>4</sub> US <<<sub>4</sub> CARRY

The Gnomonic Projection Azimuth does not replace these gauges.

It reads the accepted relation from the observer-relative axis established after gauge resolution and incidence inscription.

Canonical lock:

0x00..0xFF is the complete byte azimuth.

0x55 and 0xAA are complementary azimuthal phases.

0x55AA and 0xAA55 are balanced projection-orientation words.

Metatron scribes where the relation crossed.

The Gnomonic Projection Azimuth shows how that crossing appears.
